Preface	2
1 Introduction	5
1.1 Overview	5
1.2 Protein function	6
1.3 Types of proteins	7
1.4 Protein crystallization	7
1.5 Outline of book	9
2 Globular protein structure	11
2.1 Amino acids and primary structure	11
2.2 Secondary structure	12
2.3 Tertiary structure	13
2.4 Quaternary structure	17
3 Experimental methods	19
3.1 Methods to determine three dimensional protein structure	19
3.1.1 X-ray crystallography	19
3.1.2 NMR spectroscopy	20
3.2 Solubility measurements	20
3.3 Second virial coefficient	21
3.4 Scattering theory	21
3.5 Dynamic light scattering	23
3.6 Self-interaction and self-exclusion chromatography	24
3.7 Cloud point measurements	25
3.8 Methods of protein crystallization	25
3.9 Circular dichroism spectroscopy	26
3.10 Differential scanning calorimetry	26
3.11 High pressure liquid chromatography	26
3.12 Cross-linking	27
3.13 SDS-PAGE analysis	27
4 Thermodynamics and statistical mechanics	29
4.1 Thermodynamics	29
4.2 Free energies	30
4.2.1 Solvent entropy contribution to protein crystallization	31
4.3 McMillan-Mayer solution theory	32
4.3.1 Potential of mean force	32
4.3.2 Statistical mechanics: multicomponent system	32
4.3.3 McMillan-Mayer theory	34
4.3.4 McMillan-Mayer solution theory: mixed solvent	36
4.3.5 Ideal solution theory	37
4.3.6 Preferential interaction parameter	37
4.4 Chemical reactions	38

4.5	van't Hoff equation	41
4.6	Introduction to chemical equilibrium approach	41
4.7	Phase transitions	42
4.7.1	Introduction	42
4.7.2	Phase diagrams	43
4.7.3	Gel state	45
4.7.4	Landau theory	46
4.7.5	Renormalization group theory	47
5	Protein-protein interactions	49
5.1	Introduction	49
5.2	Excluded volume interactions	50
5.3	DLVO theory	51
5.3.1	van der Waals forces	51
5.3.2	Screened coulomb repulsion: electrical double layer	52
5.4	Asakura Oosawa depletion forces	56
5.5	Hofmeister effect	57
5.6	Ion dispersion forces	59
5.7	Hydration and hydrophobic forces	62
5.7.1	Short range oscillatory forces	65
5.7.2	Attractive hydrophobic forces	66
5.7.3	Chaotropes and kosmotropes	66
6	Theoretical studies of equilibrium	73
6.1	Simulation studies	74
6.1.1	Lennard-Jones models	74
6.1.2	Square well model	74
6.1.3	Adhesive square well model	75
6.1.4	Hard-core Yukawa model	75
6.1.5	DLVO-like model	76
6.1.6	Effect of salt type and salt concentration	76
6.2	Extended law of corresponding states	76
6.3	Thermodynamic perturbation theory	77
6.4	Correlation function approaches	78
6.4.1	Mean spherical and hypernetted chain approximations	78
6.4.2	SCOZA	79
6.5	Anisotropic models	80
6.5.1	Patch models	80
6.5.2	A model of anisotropy including specific hydration effects	84
7	Nucleation theory	87
7.1	Classical nucleation theory	87
7.2	Nucleation theorem	90
7.3	Monte Carlo studies of nucleation	90
7.4	Density functional theory of nucleation	92
7.5	Two-step nucleation theory	95
7.6	Nucleation of systems with anisotropic interactions	100
7.6.1	Kinetic approach	100
7.6.2	Lattice analog to density functional theory	104
8	Experimental studies of nucleation.	105
8.1	Direct determination of nucleation rates: lysozyme	105
8.1.1	Results	107
8.1.2	Effect of liquid-liquid phase separation on nucleation rates.	111
8.2	Direct determination of nucleation rates: HbS	114
8.3	Other measurements of HbS nucleation rate	117

8.4	Heterogeneous nucleation in porous medium	122
9	Lysozyme	125
9.1	Introduction	125
9.2	Solubility of lysozyme	126
9.2.1	Scaling of charge and salt concentration	127
9.2.2	How glycerol stabilizes globular proteins in solution	129
9.3	Liquid-liquid phase separation	129
9.3.1	The effect of phase separation on lysozyme crystallization	132
9.3.2	Thermodynamic behavior	133
9.4	Protein-protein interactions	138
9.4.1	Second virial coefficient	138
9.4.2	Diffusivity coefficient	141
9.5	Theory for charge and salt effects	144
9.6	Metastability limit for lysozyme solutions	150
9.7	Effects of PEG on protein interactions	153
9.8	Smooth transition from metastability to instability	154
9.9	Equilibrium cluster formation	158
10	Some other globular proteins	165
10.1	Introduction	165
10.2	Glucose isomerase: crystallization via liquid-liquid phase separation	165
10.3	Urate oxidase	167
10.4	BPTI	172
10.5	Alpha crystallin	173
10.6	ATCase	174
10.7	Apoferritin	174
11	Membrane proteins	175
11.1	Introduction	175
11.2	Three-dimensional crystals of membrane proteins	177
11.3	The role of protein surfactant interactions	178
11.4	Two-dimensional crystallization of membrane proteins	180
11.5	Two dimensional modified Lennard-Jones model	181
11.6	2D square well model with solvent	183
11.6.1	Introduction	183
11.6.2	Simulations	183
11.6.3	Annexin V	186
12	Crystallins and cataracts	191
12.1	Introduction	191
12.2	The crystallins	191
12.2.1	α -crystallins	191
12.2.2	β -crystallins	194
12.2.3	γ -crystallins	194
12.3	γ -crystallins	194
12.3.1	Second virial coefficient	194
12.3.2	Diffusivity coefficient	194
12.3.3	Liquid-liquid phase separation	198
12.4	Structure of the γ -crystallins and age-related cataracts	201
12.5	Genetic cataracts	205
12.5.1	γ D-crystallin mutation: R14C	205
12.5.2	Other γ D-crystallin mutations: R58H and R36S	208
12.6	Square well model of gamma-crystallins	215
12.7	Anisotropic studies	215

13 Sickle hemoglobin and sickle cell anemia	219
13.1 Experimental results	221
13.1.1 Hemoglobin S	221
13.1.2 Fiber structure	222
13.1.3 Double nucleation mechanism	226
13.1.4 Phase diagram of HbS	227
13.1.5 Liquid-liquid phase separation and nucleation in HbS	228
13.2 Theoretical studies	232
13.2.1 Kinetics	232
13.2.2 Role of solvent	237
13.3 Appendix A. Contacts within the HbS crystal.	240
14 Alzheimer’s disease	243
14.1 Introduction	243
14.2 Amyloids	243
14.3 Kinetics of fibrillogenesis	245
14.4 Soluble amyloid β -proteins and neurotoxicity	249
14.5 τ Proteins and neurofibrillary tangles	250
14.6 Modelling the soluble amyloid β protein	251
14.6.1 Experimental model	251
14.6.2 Discrete molecular dynamics (DMD)	251
14.6.3 Two-bead model	256
14.6.4 Four-bead model	258
