**Optical and mechanical properties of
mature and new transparent
*glass - ceramics***

Edgar D. Zanotto

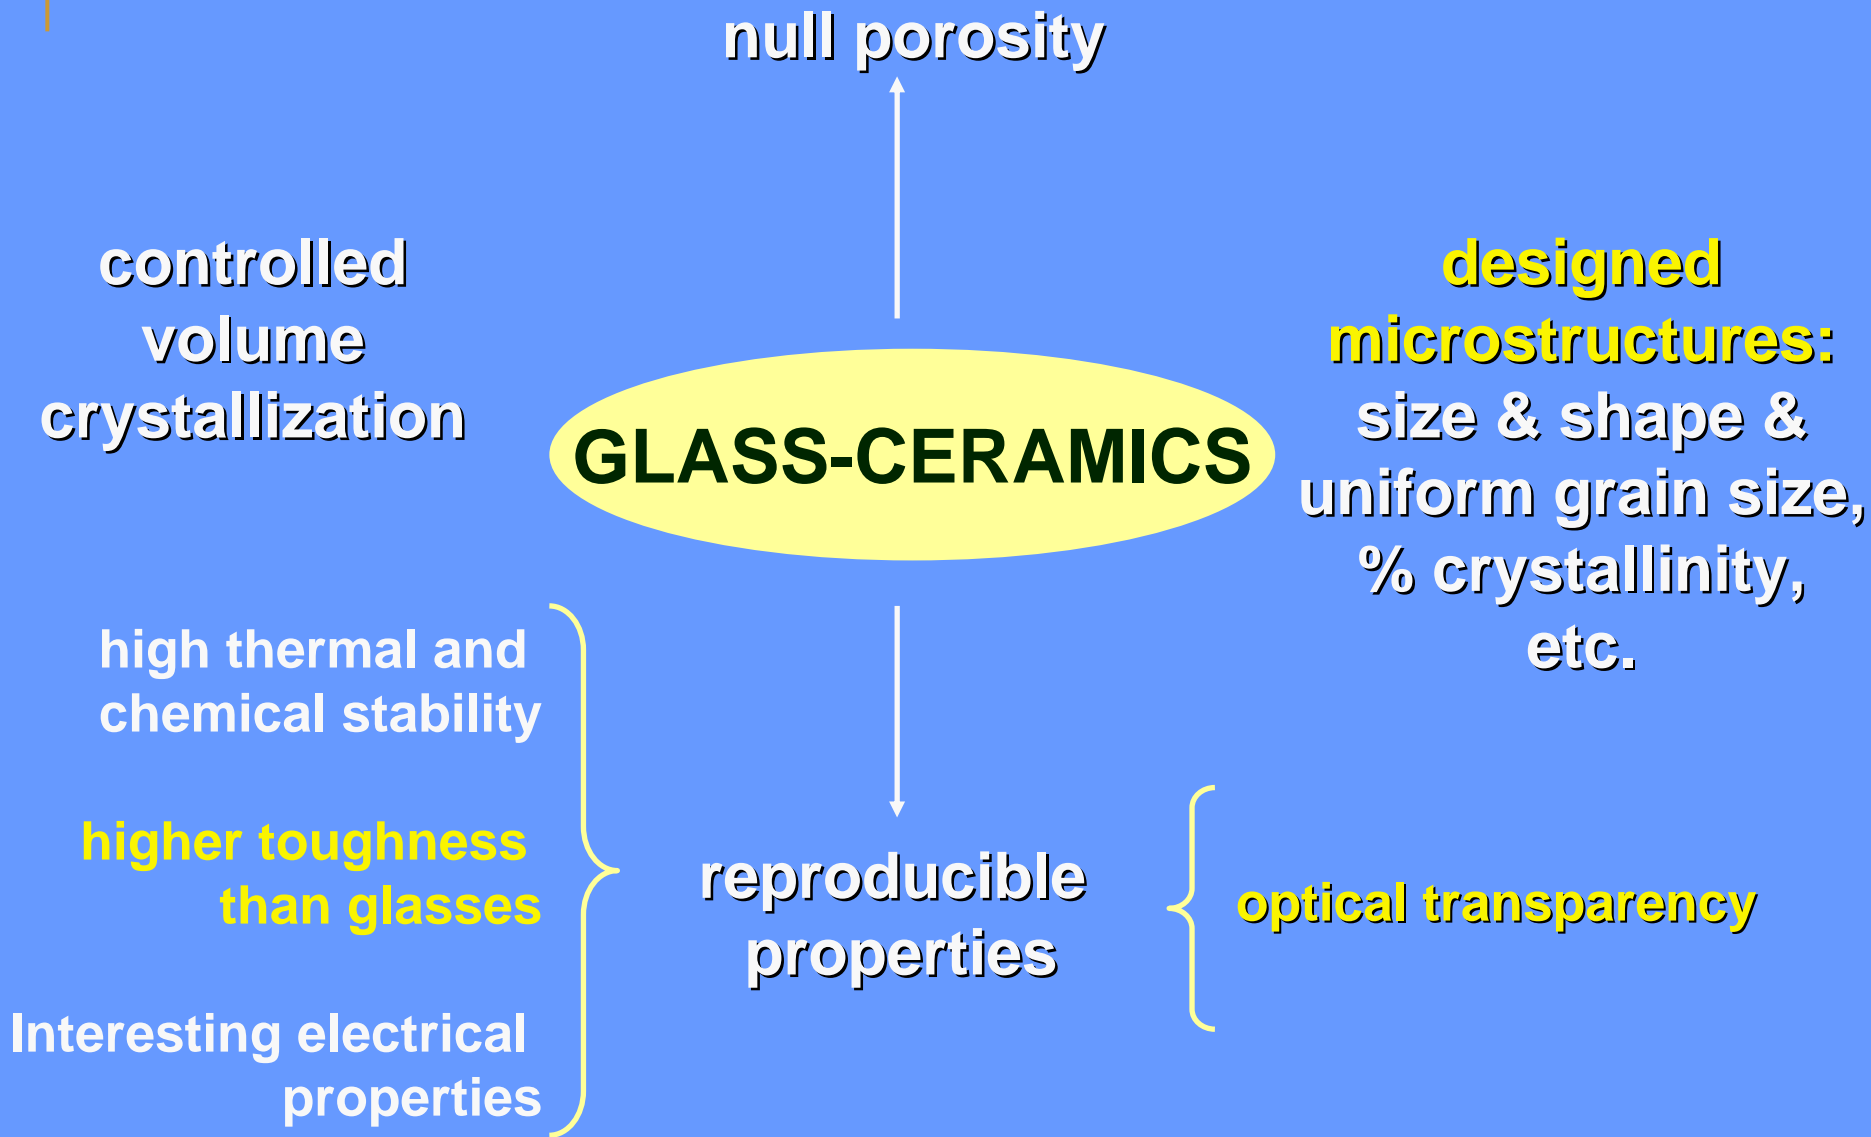

Federal University of São Carlos, Brazil

I IMI Meeting, State College, June 2005

OUTLINE

- Introduction to glass-ceramics
- Brief literature review on **TGC**
- Potential applications of **TGC**
- Conditions for transparency
- Mature TGC – nanocrystals
- **New TGC:** **Properties**
 - **Sintered aluminate GC** Opt & Mech
 - **IR transmitting CG** Opt & Mech
 - **Ce: YAG GC for lighting** Opt
 - **Laser crystallized GC** Opt
 - **PTR GC** Opt & Mech
 - **LGHC GC** Opt & Mech
- Surprise....
- Conclusions

INTRODUCTION

INTRODUCTION

Applications of transparent glass-ceramics

Thermo-mechanical

Cooking ware
Fire resistant plates
Security windows
Telescope mirrors...

Optical (potential)

saturable absorber media; illumination devices using IR; heat-resistant materials that absorb UV, that reflect infrared and are transparent to visible light; that absorb UV and fluoresce in red/IR; second harmonics generating; substrates for LCD devices; optical amplifiers for up-conver; substrates for arrayed waveguide grating (AWG); radiation sources of lamps; Laser pumps; Laser media; Materials for precision photolithography; ring laser gyroscopes; solar collectors; printed optical circuits; etc.

The inventor of GLASS-CERAMICS

Crystalline phases in TGC

- B-quartz ss
- B-eucryptite
- Mullite
- Spinel
- Willemite
- Ghanite
- Forsterite
- β -BBO
- LiNbO_3
- NaNbO_3
- PbF_2
- LaF_3
- ZnO
- Etc.

Most TGC have
nanosize crystals &
small crystallized
volume fraction
(~ 50% or less)

THEORY

Light attenuation

atomic absorption (β)

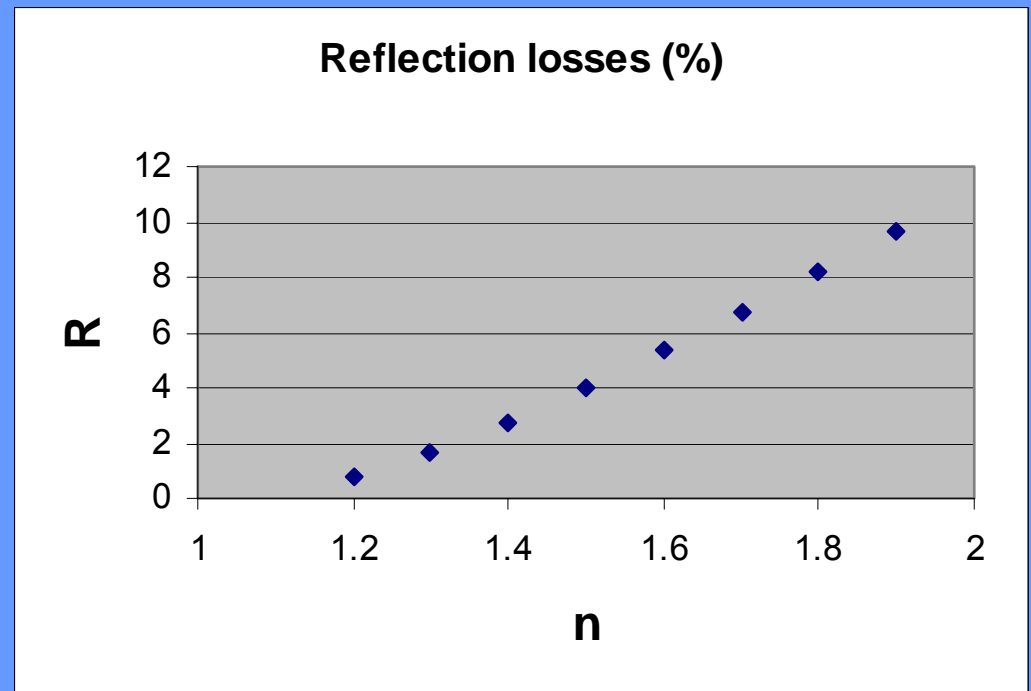

scattering (S)

+ surface reflection (R)

$$I = I_0(1 - R)^2 \exp(-(\beta + S)x)$$

$$R = \left(\frac{n-1}{n+1} \right)^2$$

Conditions for transparency

Transparent glass-ceramics

crystal size \ll wavelength of light

Basic requirements

low birefringence

$$n_{\text{glass}} \cong n_{\text{crystal}}$$

Examples of commercially mature TGC

Corning's VISION

VLT 8.2 m Zerodur mirror on its way to Paranal Observatory, Chile, Dec. 97/ Schott

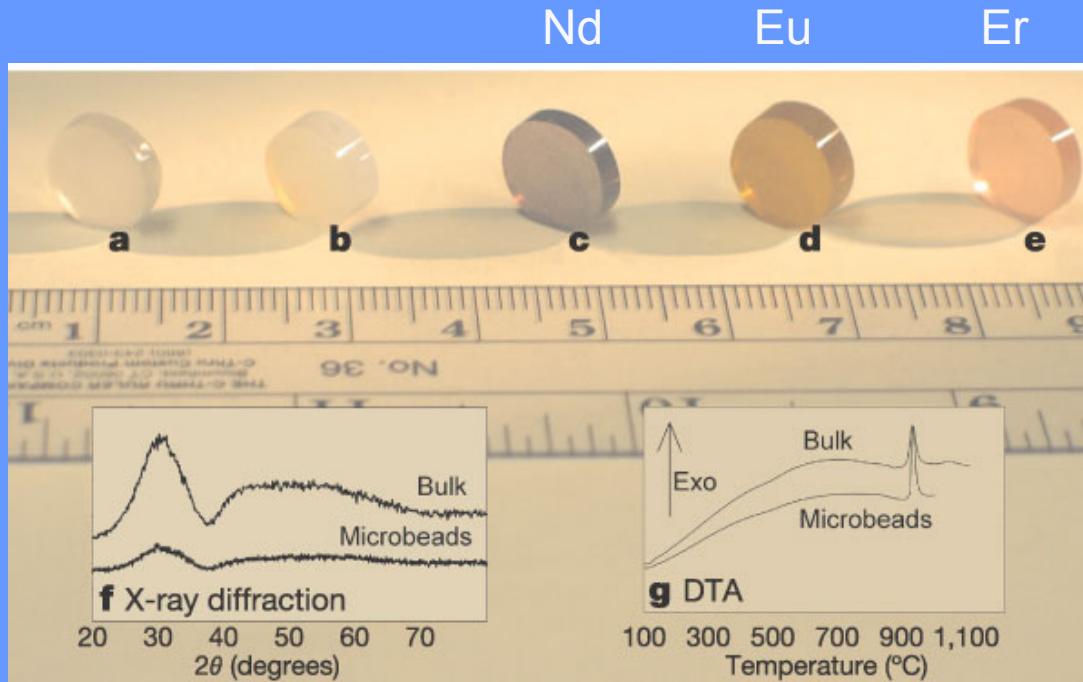

ROBAX – Schott
NEOCERAM – NIPPON

NEW
TRANSPARENT GC
(yet on the development stage)

Bulk glasses and ultrahard nanoceramics based on alumina and rare-earth oxides by A. Rosenflanz et al. *Nature* **430**, 761 - 764 (August 2004).

IR transparent

50-90% Al_2O_3

a, **b**: no dopants; **c** 5wt% Nd_2O_3 ; **d** 5wt% Eu_2O_3 ; **e** 5wt% Er_2O_3 .
All except **b** were hot-pressed at 905 $^{\circ}\text{C}$ at 34 MPa for 360 s.

Material **b** was hot-pressed for 1,200 s inducing **partial crystallization**, giving the opalescent appearance.

High alumina glasses and GC

Hardness against Al₂O₃ content. High-alumina glasses and **glass-ceramics** surpass other oxides : BeO, MgO, Y₂O₃, ZrO₂, TiO₂, Y₃Al₅O₁₂, Corning 9606 and 9608 GC, and are comparable to pure *a*-Al₂O₃ and *b*-Si₃N₄.

These compositions were also crystallized directly from the melt during slow cooling.

IR transmitting chalco-sulfide glass-ceramics

Nd:YAG ($\lambda = 1064 \text{ nm}$)

Second harmonic generation

PTR Glasses

Oxy fluor bromide glasses

S.D. Stookey et al. (1954) – Corning, USA

L.B. Glebov et al. (1990) - Vavilov SOI, Russia + Creol/ UCF, USA

- **Composition**
- **Major: SiO_2 , Na_2O , ZnO , Al_2O_3 , K_2O**
- **Minor: F, Br**
- **Dopants (~100 ppm): Ag, Ce, Sb, Sn**
- **Impurities (< 2 ppm): transition metals**

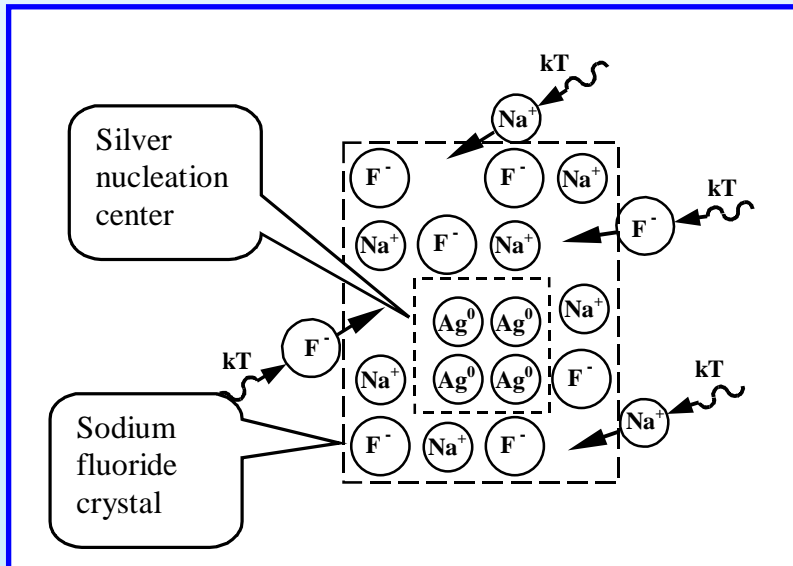

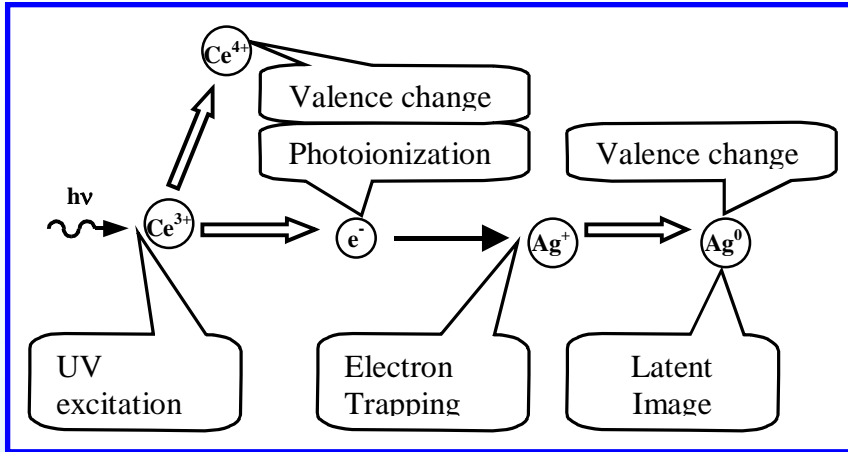

PTR glass is a F-Br sodium-zinc-aluminum-silicate glass doped with Ag, Ce, Sn and Sb

Current technology at UCF/CREOL - optical quality PTR glasses with aperture up to 50 mm.

Mechanism of photo-thermo-crystallization

3D image (hologram) of object is transformed to the phase pattern (refractive index variations) caused by selective NaF crystal distribution in accordance with the UV intensity distribution in glass interior.

PTRG (only the active ions are shown) Proposed mechanism of photo induced crystallization

Absorption spectrum of photo-thermo-refractive glass

No detectable absorption in the range of 1 μm
Absorption of hydroxyl in the range of 4 μm

PTR glasses

S.D. Stookey et. al.

Berthier

STRATEGY

Simultaneous compositional variation

**of solid solution crystals
and glassy matrix**

decreases Δn

New type of transparent glass-ceramic

small or large grain size

high crystallized
volume fraction

OPTICAL PROPERTIES

Transmission Spectra

200 nm – 1100 nm

Crystal morphology

Grain size

Degree of crystallinity OM

Transmittance measured for different sample thicknesses

Estimated parameters (P_1 and P_2):

$$\frac{I}{I_0} = P_1 \exp(-P_2 x)$$

$$P_1 = (1-R)^2$$

$$P_2 = (\beta+S)$$

MICROSTRUCTURES

The crystals are solid solutions: $TA_{4+2x}AE_{4-x}[GF_6O_{18}]$ ($0 \leq x \leq 1$)

Their morphology can vary from

J, spherical to **V8**, cubic

T = trace element

A = alkali

AE = alkaline earth

GF = Si, P, B

TRANSMITTANCE

Morphology

Distinct crystal shapes \longrightarrow Different transmittances

V8, cubic 5-6 μm
J, spherical 7-8 μm

crystal/crystal
Interfaces are
quite different for
spherical and
cubic crystals

Best transmittance \longrightarrow Cubic crystals

TRANSMITTANCE

Grain size

glass J, spherical crystals, ~42% crystallized

$I(\lambda)$ dependence

Crystal size

Affects P_2

Importance of thermal history

TRANSMITTANCE

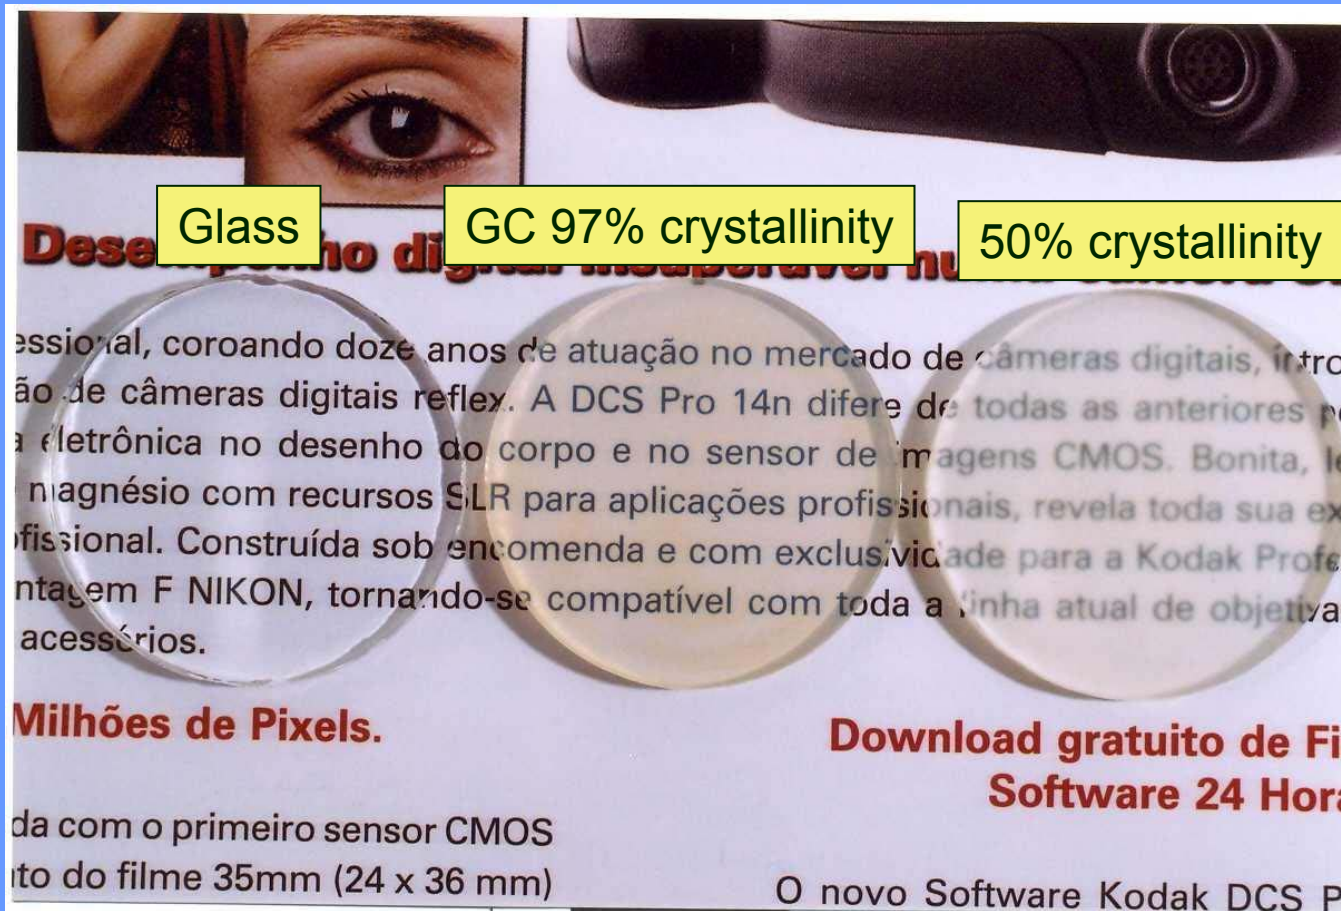

Degree of crystallinity

glass V8, cubic crystals (3-5 μm)

Glass V8 & T6, maximum transmission for ~ 95-97% OM crystallinity

The beasts! Transparency of 4 mm thick specimens

DISCUSSION

EDS measurements

alkali content in
crystals

30% > glassy matrix

DISCUSSION

**High crystallized
vol. fraction**

reduced
crystal / glass
interface

**main reasons for improved
transparency of these new TGC**

Simultaneous variations of the
glass-matrix and s/s-crystal compositions
during crystallization

**refractive indexes
of crystal and glass
verge**

Mechanical behaviour of HCHT-GC

A new, specially designed,
method of impact testing!

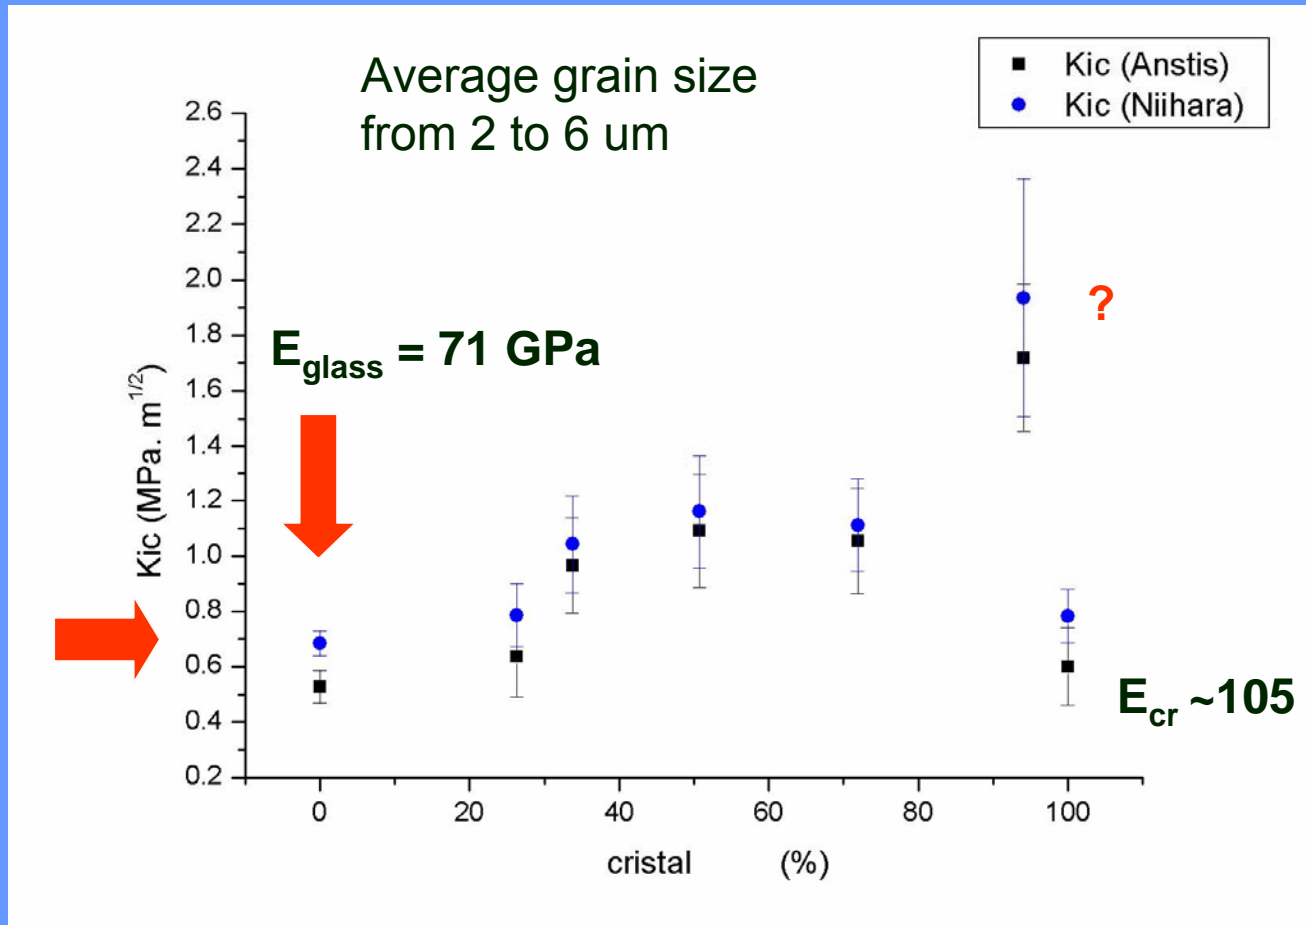

Impact testing of glass

Courtesy of Leo Siiman, Creol/ UCF

Don't try this in your
labs!

K_{ic} versus volume fraction crystallized

Anstis

$$K_{IC} = 0.016 \left(\frac{E}{H} \right)^{\frac{1}{2}} \frac{F}{c^{\frac{3}{2}}}$$

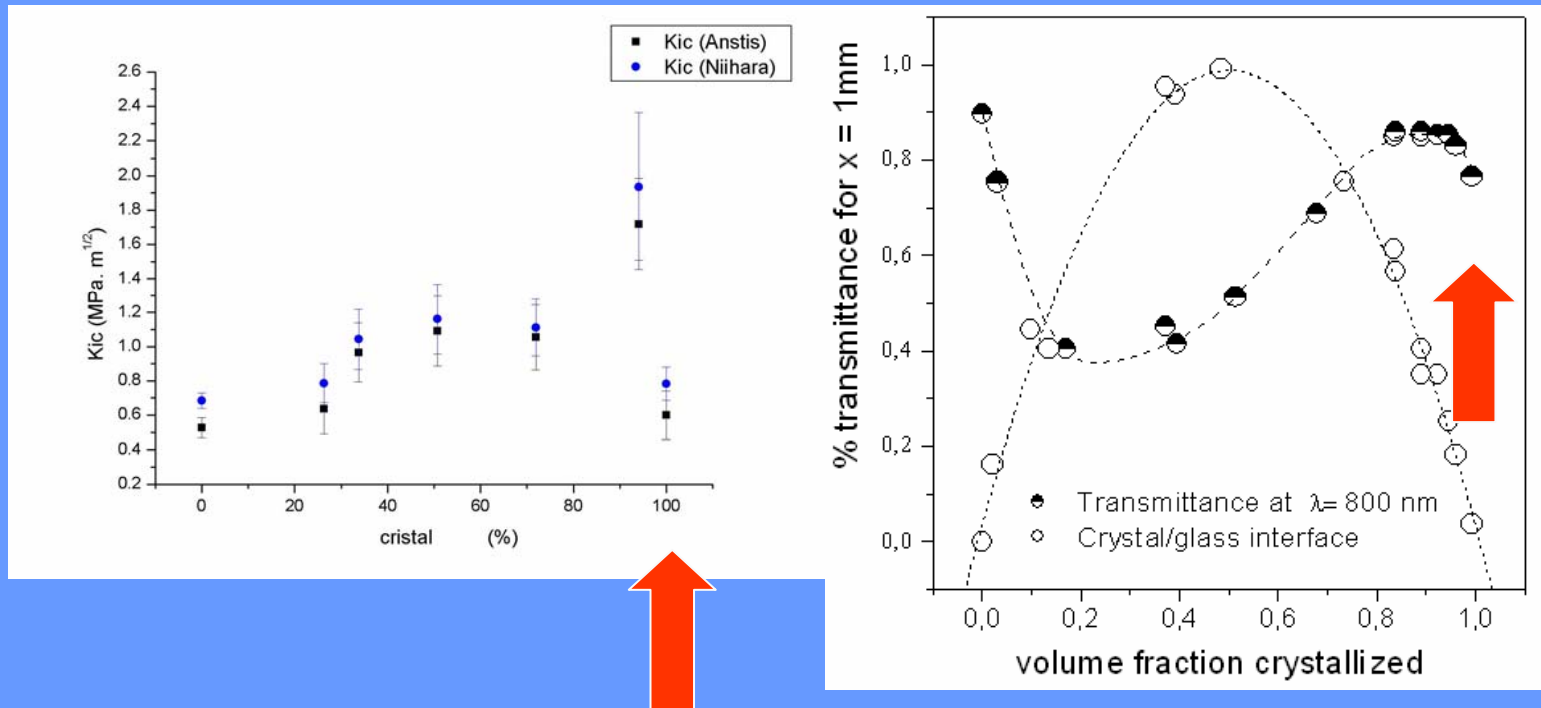

Nihara

$$k_{ic} = 0.035 \left(\frac{l}{a} \right)^{\frac{1}{2}} \left(\frac{H}{E\phi} \right)^{\frac{2}{5}} \left(\frac{H\sqrt{a}}{\phi} \right)$$

$\phi \sim 3$,
a, l, c [um]

Why do the transparency and impact strength drop significantly when crystallinity > 97%?

SPONTANEOUS CRACKING for $> 97\%$ crystallinity!

accelerated 300X

CONCLUSIONS

New
type of TGC

- highly transparent in the visible ~ 90% for 1mm
- nm to μm grain size
- up to 97% crystallized volume fraction
- good mechanical properties, which can probably be much improved by ion-exchange.
- good chemical durability
- can be drawn into fibers
- luminescence ? doping with TM and RE ions should be tested...
